

Maya Herbs Wholesale

Technical Fix & QA Summary

Developer handoff - new wholesale website launched around 1 September 2026

Objective

Stabilize the full B2B customer journey so orders cannot be missed, misrepresented, invoiced incorrectly, or presented with obsolete payment information. Start with read-only diagnosis, then fix and prove the complete flow with controlled testing.

Priority overview

Priority	Area	Required outcome
P0	New-order notifications	Every wholesale order must trigger a reliable internal Maya notification and a customer confirmation.
P0	Checkout / order creation	One controlled order must prove cart, checkout, WooCommerce order creation, emails and downstream data.
P0	SKU / variation integrity	Products, quantities, pack sizes, variation IDs, prices and VAT must remain correct end to end.
P1	PDF invoices	Redesign the current invoice output into a clean, professional B2B format.
P1	ING payment details	Remove obsolete Triodos bank details everywhere and replace only with confirmed ING details.
P1	Payments / proforma	Document and test current payment methods and clarify the order-to-payment workflow.
P1	Stock / accounts / VAT / shipping	Validate synchronization, customer roles, tax handling and delivery logic.
P2	Customer experience / technical QA	Audit desktop and mobile UX, logs, plugins, theme and custom code.

P0

1. Missing or unreliable internal new-order notifications

This is the highest-risk issue. Wholesale orders appear to be processed, but the expected WooCommerce-style internal new-order notification trail is not reliably visible. An order must never exist without Maya knowing about it.

- Check WooCommerce > Settings > Emails, especially New Order, Cancelled Order, Failed Order, On-hold, Processing and Completed order messages.
- Verify exact internal recipients and any code/plugin overrides that change recipients.
- Check SMTP configuration, provider logs, rejected/suppressed mail, sender authentication and delivery failures.

-
- Run a controlled order and prove both internal Maya notification and customer confirmation are received.

P0

2. End-to-end checkout and order creation

Test the website as a real wholesale customer rather than only reviewing settings. The full chain must work on desktop and mobile.

- Test add/remove products, quantities, wholesale prices, pack sizes, company fields, VAT number, billing/shipping addresses and shipping method.
- Test order submission, validation messages, thank-you page, WooCommerce order creation and order status.
- Check browser console/network errors, duplicate submits, failed AJAX calls and timeout behavior.
- Confirm cart totals, tax, shipping and payment method remain consistent on the order and customer email.

P0

3. Product, SKU, variation and quantity integrity

Customer reports have included wrong or missing products and quantity/variant problems. These are not yet proven to be caused by the website, so trace the data before assigning cause.

- Trace a representative order from website cart -> WooCommerce -> any integration -> proforma/invoice -> fulfilment.
- Verify SKU, variation ID, quantity, pack size, unit price and VAT at every stage.
- Pay special attention to similar options such as 50 ml vs 100 ml, 10 g vs 50 g vs 250 g vs 500 g, parent/variation products and legacy/duplicate SKUs.
- Use the Smart Bazar complaint as an investigation example, but do not assume the front end caused it.

Invoice, bank details and payment flow

P1

4. Redesign the PDF invoice format

The current customer invoice output is visually poor and needs redesign. In invoice 60289, long product descriptions run into the quantity/price area, spacing is inconsistent, and the totals section is badly laid out on the second page. This is not acceptable as a professional B2B invoice.

- Identify the exact WooCommerce plugin/template that generates the PDF.
- Create a clean column structure for product description, SKU, quantity, unit price, VAT and line total.
- Handle long product names, multi-page invoices and page breaks without collisions or excessive whitespace.
- Format company/customer/VAT information clearly and keep totals, shipping and tax summary together.
- Generate several test invoices, including a large multi-line order, and visually review the PDF before release.

Invoice example evidence: Invoice 60289 shows the old Triodos IBAN at the top, overlapping/crowded product rows on page 1, and a poorly arranged totals section on page 2. Use this file as the baseline example to improve.

P1

5. Replace obsolete Triodos bank details with confirmed ING details

The current invoice example still displays a Triodos IBAN. The intended bank is ING. The obsolete bank information must be removed from every customer-facing location.

- Check checkout bank-transfer instructions, thank-you page, emails, proformas, PDF invoices, account/order pages and WooCommerce payment settings.
- Search theme templates, custom snippets and plugins for hard-coded Triodos references.
- Do not invent the ING IBAN or BIC. Obtain and confirm the correct ING details before publishing.
- After updating, run a site-wide verification to ensure no old Triodos instructions remain.

P1

6. Payment methods and proforma workflow

The final payment-method mix is still under review. First document what is enabled and prove how each method behaves. Do not broadly alter payment options until Jorn confirms the desired final setup.

- Inventory all enabled payment methods and where each appears.
- Check resulting WooCommerce status, customer instructions and internal notification for each method.
- Clarify whether proformas are automatic or manual and what generates PRO-series numbers.
- Define and test the intended flow: customer order -> Maya receives order -> payment/proforma instructions -> payment confirmed -> release to fulfilment.

P1

7. Stock synchronization and overselling

Determine the true stock master and make sure the wholesale site does not sell unavailable inventory unless backorders are intentional.

- Identify whether WooCommerce, Brincr or another system is the stock master.
- Check sync frequency, failed jobs, Action Scheduler, webhooks, API errors, unmapped/duplicate SKUs and variation-level stock.
- Test when stock is reserved/reduced and whether cancelled/failed orders restore stock correctly.
- Do not manually alter live stock as part of testing.

P1

8. Wholesale registration, login and customer accounts

The complete B2B account journey should be tested from registration through repeat ordering.

- Test registration, approval, login/logout, password reset and wholesale role assignment.
- Verify correct wholesale prices, VAT behavior, saved addresses, previous orders and reorder flow.
- Check that retail/wholesale roles do not get mixed and approved customers retain their role.

VAT, shipping and customer experience

P1

9. VAT and EU B2B handling

Test the tax logic with representative customer types and make sure the tax status carries through checkout, order, proforma and final invoice.

- Netherlands business customer.
- EU business with a valid VAT number.
- EU customer without valid reverse-charge treatment.
- Check VAT validation, display, exemption/reverse-charge logic and billing vs shipping country behavior.
- Document findings before changing tax rules.

P1

10. Shipping logic

Shipping should be predictable and match what is ultimately charged on the order/invoice.

- Test Netherlands, Belgium, Germany and another representative EU destination.
- Check shipping zones, weight-based rates, free-shipping thresholds, minimum order rules and duplicate/missing methods.
- Test small, large/heavy and mixed-product orders.
- Verify shipping tax and displayed shipping cost remain consistent through the invoice.

P2

11. Full customer-experience audit

Use the website exactly like a first-time wholesale customer and identify anything confusing, ugly, broken or unnecessarily difficult.

- Journey: landing -> find products -> understand product -> understand wholesale price/quantity -> register/login -> cart -> checkout -> payment -> confirmation -> account -> reorder/support.
- Review navigation, search, filters, categories, product pages, images, pack sizes, pricing, VAT clarity, stock visibility, minimum quantities and calls to action.
- Test desktop and mobile layouts, loading speed, broken links, error messages, trust/company information, contact/support visibility and legal pages.
- Include basic accessibility/readability issues where obvious.

P2

12. Technical logging and observability

The system needs enough logging that failures can be diagnosed without waiting for a customer complaint.

- Review WooCommerce logs, WordPress/PHP errors, Action Scheduler, SMTP logs, payment logs, webhook/API logs and cron failures.
- Check browser console/network errors during checkout.
- Create a simple internal note explaining where Maya staff can check system health and failed jobs.

P2

13. Plugin, theme and custom-code audit

Document the technical stack and look for conflicts or overrides that affect checkout, emails, order status, invoices or stock.

- Record WordPress, WooCommerce, theme/child theme and key plugin versions.
- Review wholesale, checkout, payment, SMTP, PDF invoice/proforma, caching/security and integration plugins.

- Inspect functions.php, child theme, Code Snippets, mu-plugins and custom plugins for WooCommerce email/order/status/stock hooks.
- Do not bulk-update the live site merely because updates are available. Prefer staging for risky changes.

Required issue-reporting format

Field	What to record
Problem	Short, specific description
Severity	P0 / P1 / P2 / P3
Location	Page, settings path, plugin, template or order
Reproduction	Exact steps to reproduce
Expected vs actual	What should happen vs what happened
Evidence	Screenshot, email, log entry, order number or test timestamp
Cause	Confirmed root cause or clearly labeled hypothesis
Fix	Proposed or applied change
Risk / rollback	Impact and how to revert
Retest	Pass/fail after the change

Working rules

- **Read-only diagnosis first.** Understand the current setup before changing it.
- Do not make consequential live changes to pricing, VAT, shipping rates, stock, payment gateways, integrations/API credentials, DNS or major plugin configuration without approval.
- Keep confirmed defects separate from suspected causes.
- Record every change, test result and rollback path.

FIRST MILESTONE

Place one controlled wholesale test order and prove the entire chain works:

Cart -> Checkout -> WooCommerce Order -> Maya Internal Notification -> Customer Confirmation -> Payment Instructions / Proforma / Invoice -> Downstream Order Data

Do not consider the core order flow stable until this test passes end to end.

Prepared as a consolidated technical handoff from the issues identified in the current Maya Herbs Wholesale review.
